

How to get an old but sufficient version of the **countreg** package onto your computer, when installing from R-Forge doesn't work, in 8 easy steps

1. Close R/R Studio down. Visit https://r-forge.r-project.org/R/?group_id=522
2. Click the button that says **Show/Hide extra info/Download older Version**. Your screen should then look like this:

3. Select the Old Version Download that applies to your machine (use .zip for Windows, and .tar.gz for Mac) and download that file to a place on your computer you can find. Do not unzip the file. Just download it as it is. That is the package archive for **countreg**.
4. Close your browser once the download is complete, and open R Studio.
5. Click on the **Packages** tab (on the bottom right) and select the **Install** tab. This will open up a dialog box that looks like this:

6. As indicated, change the top section (Install from:) from its default to indicate that you want to Install from a Package Archive File, as I've done here.
7. Browse to the place on your computer where you stored the package archive (.zip for Windows, .tar.gz for Mac) and then hit Install on the dialog box. R Studio should now install the package. To see if it worked, look in your list of available packages to see if countreg appears. To **really** see if it worked, try running a rootogram after running library(countreg).

Let us know at 431-help if this doesn't solve your problem.
